Esercitazione in classe sulle curve

Esercizio 2.1.1. Sia γ la curva piana una cui parametrizzazione in coordinate polari è $\rho(\vartheta) = \vartheta^2 + 1$, on $0 \le \vartheta \le 2\pi$. Dopo aver disegnato sommariamente il sostegno di γ , determinare i versori tangente e normale al sostegno di γ nel punto $\gamma(\pi)$ e scrivere un'equazione della retta tangente nello stesso punto.

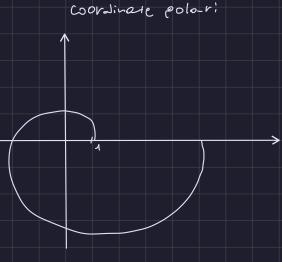

$$\rho(\theta) = \theta^2 + 1$$
 $\theta \in [0, 2\pi]$

In coordinate cartesiane equivale a

$$(x(\theta) = p(\theta)) \cos \theta = (\theta^2 + 1) \cos \theta$$

 $(x(\theta) = p(\theta)) \sin \theta = (\theta^2 + 1) \sin \theta$

Diamo valori a caso a theta e plottiamo il grafico a grandi linee

Rappresenta la curva

$$\begin{array}{l}
\text{Natural La Cut Va} \\
Y(\Theta) = (X(\Theta), Y(\Theta)) = ((\Theta^2 + 1) \cos \Theta, (\Theta^2 + 1) \sin \Theta) \\
Y'(\Theta) = (2\Theta\cos\Theta - (\Theta^2 + 1) \sin\Theta, 2\Theta \sin\Theta + (\Theta^2 + 1) \cos\Theta) \\
\|Y'(\Theta)\| = \sqrt{4\Theta^2 \cos^2 \Theta - 4\Theta (\Theta^2 + 1) \cos \Theta \sin \Theta} + (\Theta^2 + 1)^2 \sin \Theta + (\Theta^2 + 1)^2 \sin \Theta + (\Theta^2 + 1)^2 \cos^2 \Theta + (\Theta^2 + 1)^2 \cos^2 \Theta
\end{array}$$

$$=\sqrt{4\Theta^2+(\Theta^2+1)^2}$$

Tangente:

$$T(\Theta) = \frac{\delta'(\Theta)}{||\delta'(\Theta)||} =$$

$$(2\Theta\omega s\Theta - (\Theta^2 + 1)sin\Theta, 2\Theta sin\Theta + (\Theta^2 + 1)\omega s\Theta)$$

$$\sqrt{4\Theta^2+(\Theta^2+1)^2}$$

$$T(\pi) = \frac{(-2\pi) - (\pi^2 + 1)}{\sqrt{4\pi^2 + (\pi^2 + 1)^2}}$$

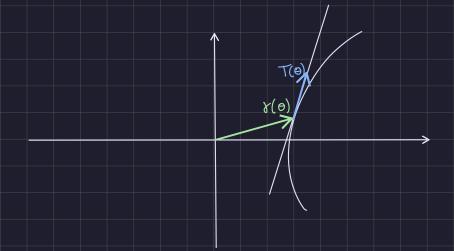

Direzione della tangente in pi

In R² il versore normale è il versore tangente ruotato di 90°

$$N(\pi) = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix} T(\pi)$$

$$\begin{pmatrix} 65\theta & -5in\theta \\ 5in\theta & 65\theta \end{pmatrix}$$

Per trovare la retta tangente alla curva bisogna trovare quel vettore che sposta lo spazio vettoriale formato dal vettore tangente sopra la curva e quel vettore è proprio $\gamma(\theta)$

Quindi la retta tangente è:

🛎 Esercizio 2.2.4. Calcolare l'integrale (curvilineo) di

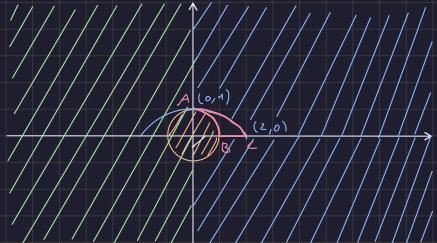

$$f(x,y) = \frac{xy}{\sqrt{4+x^2}}$$

lungo la curva γ il cui sostegno è il bordo ∂E di

$$E = \left\{ (x, y) : \underbrace{x \ge 0}_{}, \underbrace{x^2 + y^2 \ge 1}_{}, \underbrace{0 \le y \le 1 - \frac{x^2}{4}}_{} \right\}$$

e determinare la retta tangente a γ nel punto $\left(1, \frac{3}{4}\right)$.

Disegnamo l'insieme E

Consideriamo solo l'area rossa

Integriamo lungo le 3 curve parametrizzate:

$$Y_{BA}(t) = (\cos t, \sin t) \quad t \in [0, \frac{\pi}{2}]$$

$$\delta_{BC}(t) = (t, 0) \ t \in [1, 2]$$

$$\delta_{AC}(t) = \left(t, 1 - \frac{t^2}{4}\right)$$

$$= -\frac{1}{2} \left(\frac{1}{\sqrt{4 + \omega}} \right)^{\frac{1}{2}}$$

$$= -\sqrt{4 + \omega s^{2} \varepsilon} = -2 + \sqrt{5}$$

Retta tangente a γ in (1,3/4) (γ (1))

$$\delta_{AC}(t) = (t, 1 - \frac{t^2}{4}) \rightarrow t \mid \delta_{AC}(t) = (1, \frac{3}{4}) \Rightarrow t = 1$$

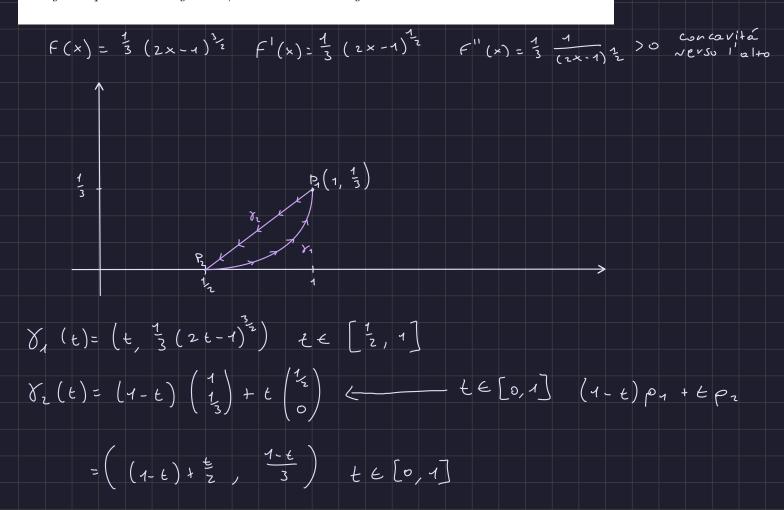

$$\begin{cases} x(t) = 1 \\ y(t) = \frac{3}{4} \end{cases}$$

Esercizio 2.1.2. Determinare una parametrizzazione della curva chiusa γ che si ottiene percorrendo prima da sinistra verso destra il grafico di $f(x) = (1/3)(2x-1)^{3/2}$ per $1/2 \le x \le 1$ e poi da destra a sinistra il segmento congiungente gli estremi del grafico di f stessa. Disegnare quindi il sostegno di γ e calcolarne la lunghezza.

Le due rette sono definite nello stesso intervallo, quindi in t = 1/2 si avrà un valore corrispondente a 2 rette contemporaneamente, e noi non vogliamo questo, ma vogliamo che gamma2 sia collegata a gamma1. Cambiamo di nuovo parametrizzazione

$$\begin{cases}

△ Esercizio 3.3.7. Calcolare

$$\lim_{(x,y)\to(0,0)} \frac{xy^3 - 2\sin(x^2y)\cos(x+2y)}{x^2 + y^2}$$

Se
$$(x,0) \to \lim_{x\to 0} \frac{0-0 \cdot \omega_3(x)}{x^2} = 0$$

Se $(0,0) \to \lim_{x\to 0} \frac{0-0 \cdot \omega_3(20)}{y^2} = 0$

Il limite, fissato x e fissato y esiste, quindi bisogna trovare un'altra sequenza che non tenda a 0

$$\frac{x y^{3}}{x^{2}+y^{2}} - 2 \lim_{(x,y)\to(0,0)} \frac{\sin(x^{2}y) \omega_{5}(x+2y)}{x^{2}+y^{2}}$$

$$\frac{x^{2}+y^{2}}{\sin(x^{2}y) \to (0,0)} = x^{2}+y^{2}$$

$$\frac{x^{2}+y^{2}}{\sin(x^{2}y) \to (0,0)} = x^{2}+y^{2}$$

$$\frac{x^{2}+y^{2}}{\cos(x+2y) \to (0,0)}$$

$$Sin(x^2y) = X^2y + o(x^2y)$$

$$Los(x+2y) = A + o(x+2y)$$

$$\lim_{(x,y)\to(0,0)} \frac{x^{2}y}{x^{2}+y}$$

$$|x| = |x| = |x|$$

$$0 \le \lim_{(x,y) \to (0,0)} \frac{|xy^3|}{x^2 + y^2} = \lim_{(x,y) \to (0,0)} |xy| \frac{y^2}{x^2 + y^2} \le \lim_{(x,y) \to (0,0)} |x,y| = 0$$

$$(x,y) \to (0,0)$$

$$(x,y) \to (0,0)$$

Quindi il limite esiste

Un altro modo è quello di usare le coordinate polari

$$\lim_{\rho \to 0} \frac{\rho^4 \cos \theta \sin^3 \theta - 2 \sin(\rho^3 \cos^2 \theta \sin \theta) \cos(\rho \cos \theta + 2 \rho \sin \theta)}{\rho^2}$$

Metodo 2 Esplicitazione del vincolo

Il vincolo è di disuguaglianza, ma visto che abbiamo già fatto ottimizzazione libera e abbiamo visto che all'interno c'è una sella possiamo considerare solo il bordo e quindi diventa un'uguaglianza

$$4x^{2}+y^{2}=1$$

$$(2x)^{2}+y^{2}=1 \rightarrow Porametrizzazione$$

$$y = sin\theta$$

$$(x = \frac{6}{2})$$

$$y = sin\theta$$

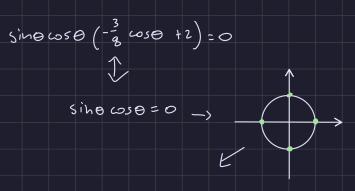

$$(x = \frac{6}{2})$$

$$y = sin\theta$$

$$(x,y) = x^{3}+y^{2} \rightarrow F(\theta) = \frac{6}{8} + sin^{2}\theta$$

La funzione è diventata ad una sola variabile e si può ottimizzare come in analisi 1

$$F'(\theta) = 0 \rightarrow F'(\theta) = \frac{3}{8} \cos^2 \theta (-\sin \theta) + 2 \sin \theta \cos \theta$$

$$\begin{cases} X_{k} = \frac{\cos(k \frac{\pi}{2})}{2} & (\frac{1}{2}, 0) = C & \text{K=0} \\ Y_{k} = \sin(k \frac{\pi}{2}) & (0, 1) = A & \text{K=1} \\ & (-\frac{1}{2}, 0) = D & \text{K=2} \\ & (0, -1) = B & \text{K=3} \end{cases}$$

3) Trovare il valore massimo e il valore minimo di $f(x,y) = 9xy^2 - x^2y^2 - xy^3$ sulla regione triangolare chiusa nel piano xy di vertici (0,0), (0,6) e (6,0)

$$F(x,y) = xy^{2}(4-x-y)$$

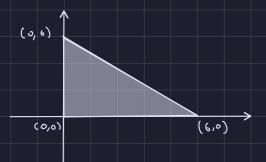

$$\overline{\nabla} F(x,y) = \left(4y^{2} - 2xy^{2} - y^{3}\right)$$

$$8xy - 2x^{2}y - 3xy^{2}$$

$$= \left(y^{2}(4-2x-y)\right)$$

$$xy(8-2x-3y)$$

$$\begin{cases} y^{2}(4-2x-3)=0 \\ xy(8-2x-3y)=0 \\ 1 \end{cases}$$

Y lo abbiamo già
$$(4-2\times-3=0)$$
 esaminato, quindi lo togliamo $(3-2\times-3=0)$

X lo abbiamo già esaminato, quindi lo togliamo

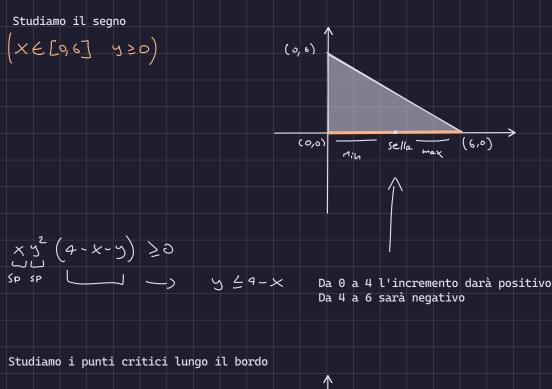

I punti critici sono:

$$H_{c}(x,y) = \begin{pmatrix} 2y^{2} & 8y - 4xy - 3y^{2} \\ 8y - 4xy - 3y^{2} & 8x - 2x^{2} - 6y^{2} \end{pmatrix}$$

$$H_{\epsilon}(0,4) = \begin{pmatrix} 32 & -76 \\ -76 & 0 \end{pmatrix} \longrightarrow \text{Autovalori discordi (det = prodotto di autovalori)}$$

The state of the st

10) Sia
$$F(x,y) = C$$

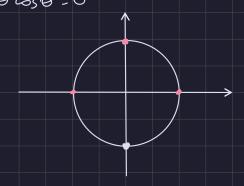

a) Calcolare i punti criti

- a) Calcolare i punti critici e gli estremi locali di f, specificando se sono globali
- b) Trovare massimo e minimo assoluti di f su $E = \{(x, y) \in \mathbb{R}^2 : x^2 + y^2 \neq 2, y \geq 0\}$

Non abbiamo trovato i punti di massimo perchè il semicerchio forma un angolo retto con l'asse x e Lagrange non si applica più perchè non è un punto regolare, quindi troviamo una nuova parametrizzazione per il semicerchio

 $-4 \cos \theta \sin \theta \left(2 \sin \theta + 4\right) - 2 \cos^{2} \theta \sin \theta \cos \theta = 0$ $2 \sin \theta \cos \theta \left(-2 \left(2 \sin^{2} \theta + 1\right) - 4 \cos^{2} \theta\right) = 0$ $2 \sin \theta \cos \theta \left(-4 \sin \theta - 4 \cos^{2} \theta - 2\right) = 0$ $-12 \sin \theta \cos \theta = 0$

Ora si possono trovare i punti di massimo
