Inoltre si determini il valore  $\alpha > 0$  per cui  $\frac{y(t)}{t^{\alpha}}$  tende a un numero finito e non nullo per  $t \to +\infty$ .

$$\frac{\chi E^2}{E^2 + a_0} = lim = \frac{E^2}{2 E^2}$$

L'unico modo per avere un numero finito è che il grado del numeratore e del denominatore sia uguale, quindi:

7+ 64 = 1

$$d = 2 \rightarrow \lim_{\epsilon \to +\infty} \frac{t^2}{2\epsilon^2} = \lim_{\epsilon \to +\infty} \frac{1}{2} = \frac{1}{2}$$
